

Balancing Equations, pt.2 (clearing constants)

Suppose you have the equation $3x = 21$.

Is there a way to solve this by balancing the equation? Yes, there is. Now, you may already know the answer to the above equation, but here is a method to solve such problems.

Recall, that a number has a reciprocal, such that when the two are multiplied together, they equal one.

Ex. 3 and $\frac{1}{3}$ are reciprocals

Because $3 \cdot \frac{1}{3} = 3/3 = 1$

Ex. $\frac{2}{5}$ and $\frac{5}{2}$ are reciprocals because:

$\frac{2}{5} \cdot \frac{5}{2} = 10/10 = 1$

Using this information, we can balance the first equation by multiplying both sides by the reciprocal of the coefficient in front of the variable.

$$\begin{aligned}\text{So, } 3x &= 21 \\ (\frac{1}{3})3x &= (\frac{1}{3})21 \\ (\frac{3}{3})x &= (21/3) \\ x &= 7\end{aligned}$$

ex. $(\frac{5}{3})x = 15$

$$\begin{aligned}(\frac{3}{5})(\frac{5}{3})x &= (\frac{3}{5})15 \\ 1x &= 45/5 \\ x &= 9\end{aligned}$$

ex. $(\frac{1}{5})x = a + b$

$$\begin{aligned}(\frac{5}{1})(\frac{1}{5})x &= (\frac{5}{1})(a + b) \leftarrow \text{simplify, distribute} \\ x &= 5a + 5b\end{aligned}$$

exercises:

- 1.) $(\frac{3}{5})x = 15$
- 2.) $7x = 21$
- 3.) $(\frac{12}{3})x = 6$
- 4.) $(\frac{2}{3})x = 4$
- 5.) $(\frac{3}{5})x = 9$
- 6.) $(\frac{4}{8})x = 8$
- 7.) $(\frac{7}{2})x = 14$
- 8.) $(\frac{6}{4})x = 12$
- 9.) $(\frac{5}{3})x = 5$
- 10.) $(\frac{1}{2})x = 2$
